

Vishal Theme - WordPress Theme File Explanation

index.php

Main template file that loads the homepage content.

Uses WordPress loop (have_posts + the_post) to fetch posts.

Includes header and footer using get_header() and get_footer().

header.php

Contains the HTML <head> section and opening <body>.

Dynamically prints site title and description using bloginfo().

Includes wp_head() to load essential WordPress scripts/styles.

footer.php

Closes the body and HTML tags and includes the site footer.

Adds custom footer content and copyright.

Includes wp_footer() to support plugins and script injection.

functions.php

Registers theme features like dynamic title tag and thumbnails.

Wrapped inside a function and hooked into after_setup_theme.

Improves theme compatibility with WordPress core features.

style.css

Contains theme metadata required by WordPress to recognize the theme.

Defines basic visual styles for body, headings, and layout.

The comment block at the top is what registers the theme in WP admin.
